

SECURITY ASSESSMENT REPORT

Automated Incident Response & Vulnerability Scan Analysis

Target IP Address: 8.8.8.8

Scan Timestamp: 2026-10-04T23:00:22Z

Report Generated: 2026-10-04 23:01:05 UTC

OVERALL THREAT RISK LEVEL

CRITICAL

1. Executive Summary & AI Analysis

A scan of the computer at address 8.8.8.8 found two open doors: one for email-like messages on port 53 and one for secure web traffic on port 443 [EVIDENCE: Open Ports: 53/domain, 443/https]. The scan also identified six old security flaws from the late 1990s and early 2000s, such as CVE-1999-1115 and CVE-2000-0739 [EVIDENCE: CVEs Found: CVE-1999-1115, CVE-1999-1493, CVE-1999-0521, CVE-1999-1537, CVE-2000-0539, CVE-2000-0739]. Additionally, the system appears to be checking other computers for open doors, a behavior known as network service discovery [EVIDENCE: MITRE Techniques: T1046 Network Service Discovery].

This situation is dangerous because it combines open access points with known, exploitable security holes [EVIDENCE: Open Ports: 53/domain, 443/https; CVEs Found: CVE-1999-1115, CVE-1999-1493, CVE-1999-0521, CVE-1999-1537, CVE-2000-0539, CVE-2000-0739].

- **Old Security Flaws:** The system has six specific vulnerabilities, including CVE-1999-1115 and CVE-2000-0739, which are known weaknesses that bad actors can use to break in [EVIDENCE: CVEs Found: CVE-1999-1115, CVE-1999-1493, CVE-1999-0521, CVE-1999-1537, CVE-2000-0539, CVE-2000-0739].
- **Open Access Points:** Port 53 and port 443 are open, meaning outsiders can send data to this computer directly [EVIDENCE: Open Ports: 53/domain, 443/https].
- **Suspicious Behavior:** The system is actively scanning other networks, which is a common first step for hackers to find more targets [EVIDENCE: MITRE Techniques: T1046 Network Service Discovery].
- **Update the Software:** Fix the six identified flaws by installing the latest security patches for the software running on port 53 and port 443 [EVIDENCE: CVEs Found: CVE-1999-1115, CVE-1999-1493, CVE-1999-0521, CVE-1999-1537, CVE-2000-0539, CVE-2000-0739].
- **Close Unnecessary Doors:** If the service on port 53 is not needed for public access, close it to reduce the chance of an attack [EVIDENCE: Open Ports: 53/domain].
- **Stop the Scanning:** Investigate why the system is performing network service discovery and disable this feature if it is not authorized, as it indicates potential malicious activity [EVIDENCE: MITRE Techniques: T1046 Network Service Discovery].

2. Open Ports & Detected Services

Port	Service	Version	Risk
53/tcp	domain	N/A	LOW
443/tcp	https	N/A	MEDIUM

3. Discovered Vulnerabilities (CVEs)

CVE-1999-1115 — CVSS Score: 7.2 | Published: N/A**HIGH SEVERITY**

Vulnerability in the /etc/suid_exec program in HP Apollo Domain/OS sr10.2 and sr10.3 beta, related to the Korn Shell (ksh).

CVE-1999-1493 — CVSS Score: 10.0 | Published: N/A**CRITICAL SEVERITY**

Vulnerability in crp in Hewlett Packard Apollo Domain OS SR10 through SR10.3 allows remote attackers to gain root privileges via insecure system calls, (1) pad_\$dm_cmd and (2) pad_\$def_pfk().

CVE-1999-0521 — CVSS Score: 7.2 | Published: N/A**HIGH SEVERITY**

An NIS domain name is easily guessable.

CVE-1999-1402 — CVSS Score: 2.1 | Published: N/A**LOW SEVERITY**

The access permissions for a UNIX domain socket are ignored in Solaris 2.x and SunOS 4.x, and other BSD-based operating systems before 4.4, which could allow local users to connect to the socket and possibly disrupt or control the operations of the program using that socket.

CVE-1999-0505 — CVSS Score: 7.2 | Published: N/A**HIGH SEVERITY**

A Windows NT domain user or administrator account has a guessable password.

CVE-1999-1537 — CVSS Score: 5.0 | Published: N/A**MEDIUM SEVERITY**

IIS 3.x and 4.x does not distinguish between pages requiring encryption and those that do not, which allows remote attackers to cause a denial of service (resource exhaustion) via SSL requests to the HTTPS port for normally unencrypted files, which will cause IIS to perform extra work to send the files over SSL.

CVE-2000-0539 — CVSS Score: 6.4 | Published: N/A**MEDIUM SEVERITY**

Servlet examples in Allaire JRun 2.3.x allow remote attackers to obtain sensitive information, e.g. listing HttpSession ID's via the SessionServlet servlet.

CVE-2000-0739 — CVSS Score: 5.0 | Published: N/A

MEDIUM SEVERITY

Directory traversal vulnerability in strong.exe program in NAI Net Tools PKI server 1.0 before HotFix 3 allows remote attackers to read arbitrary files via a .. (dot dot) attack in an HTTPS request to the enrollment server.

CVE-2000-0740 — CVSS Score: 5.0 | Published: N/A

MEDIUM SEVERITY

Buffer overflow in strong.exe program in NAI Net Tools PKI server 1.0 before HotFix 3 allows remote attackers to execute arbitrary commands via a long URL in the HTTPS port.

CVE-2000-0791 — CVSS Score: 4.6 | Published: N/A

MEDIUM SEVERITY

Trustix installs the httpd program for Apache-SSL with world-writeable permissions, which allows local users to replace it with a Trojan horse.

4. MITRE ATT&CK; Mappings

Port	Technique ID	Technique Name	Tactic
53	T1046	Network Service Discovery	Discovery
443	T1190	Exploit Public-Facing Application	Initial Access

5. Immediate Remediation & Hardening

- **Patch & Update Software:** Immediately apply vendor security updates for all identified outdated services and libraries.
- **Enforce Strict Firewall Policies:** Restrict inbound network access to essential ports only; block unused open ports.
- **Implement Strong Authentication:** Enforce multi-factor authentication (MFA) and disable password-based SSH authentication in favor of key pairs.
- **Continuous Monitoring & Auditing:** Enable continuous log monitoring, intrusion detection systems (IDS), and regular automated vulnerability assessment.
