

SECURITY ASSESSMENT REPORT

Automated Incident Response & Vulnerability Scan Analysis

Target IP Address: 8.8.8.8

Scan Timestamp: 2026-09-13T06:24:45Z

Report Generated: 2026-09-13 06:25:08 UTC

OVERALL THREAT RISK LEVEL

CRITICAL

1. Executive Summary & AI Analysis

SUMMARY

A quick check of the address 8.8.8.8 showed that two services are reachable: one that handles internet name lookups (port 53) and one that serves secure web traffic (port 443). The scan also listed a handful of very old software bugs that were reported over 20 years ago and are unlikely to affect today's versions of those services.

RISK LEVEL

Overall it is not an immediate danger, but the presence of old bugs means the system should still be reviewed.

TOP CONCERNS

- The name lookup service (port 53) is publicly visible, so anyone can try to talk to it.
- The secure web service (port 443) is also exposed, which could attract attackers looking for weaknesses.
- The list includes outdated vulnerability reports; even if they are probably fixed, they remind us to keep software up to date.

WHAT TO DO

- Verify that the software running on ports 53 and 443 is the latest version and has all security updates applied.
- Limit access to the name lookup service if it does not need to be reachable from the whole internet.
- Run a modern vulnerability scan or ask a security professional to double check that no current weaknesses exist.

2. Open Ports & Detected Services

Port	Service	Version	Risk
53/tcp	domain	N/A	LOW
443/tcp	https	N/A	MEDIUM

3. Discovered Vulnerabilities (CVEs)

CVE-1999-1115 — CVSS Score: 7.2 | Published: N/A

HIGH SEVERITY

Vulnerability in the /etc/suid_exec program in HP Apollo Domain/OS sr10.2 and sr10.3 beta, related to the Korn Shell (ksh).

CVE-1999-1493 — CVSS Score: 10.0 | Published: N/A**CRITICAL SEVERITY**

Vulnerability in crp in Hewlett Packard Apollo Domain OS SR10 through SR10.3 allows remote attackers to gain root privileges via insecure system calls, (1) pad_\$dm_cmd and (2) pad_\$def_pfk().

CVE-1999-0521 — CVSS Score: 7.2 | Published: N/A**HIGH SEVERITY**

An NIS domain name is easily guessable.

CVE-1999-1402 — CVSS Score: 2.1 | Published: N/A**LOW SEVERITY**

The access permissions for a UNIX domain socket are ignored in Solaris 2.x and SunOS 4.x, and other BSD-based operating systems before 4.4, which could allow local users to connect to the socket and possibly disrupt or control the operations of the program using that socket.

CVE-1999-0505 — CVSS Score: 7.2 | Published: N/A**HIGH SEVERITY**

A Windows NT domain user or administrator account has a guessable password.

CVE-1999-1537 — CVSS Score: 5.0 | Published: N/A**MEDIUM SEVERITY**

IIS 3.x and 4.x does not distinguish between pages requiring encryption and those that do not, which allows remote attackers to cause a denial of service (resource exhaustion) via SSL requests to the HTTPS port for normally unencrypted files, which will cause IIS to perform extra work to send the files over SSL.

CVE-2000-0539 — CVSS Score: 6.4 | Published: N/A**MEDIUM SEVERITY**

Servlet examples in Allaire JRun 2.3.x allow remote attackers to obtain sensitive information, e.g. listing HttpSession ID's via the SessionServlet servlet.

CVE-2000-0739 — CVSS Score: 5.0 | Published: N/A**MEDIUM SEVERITY**

Directory traversal vulnerability in strong.exe program in NAI Net Tools PKI server 1.0 before HotFix 3 allows remote attackers to read arbitrary files via a .. (dot dot) attack in an HTTPS request to the enrollment server.

CVE-2000-0740 — CVSS Score: 5.0 | Published: N/A

MEDIUM SEVERITY

Buffer overflow in strong.exe program in NAI Net Tools PKI server 1.0 before HotFix 3 allows remote attackers to execute arbitrary commands via a long URL in the HTTPS port.

CVE-2000-0791 — CVSS Score: 4.6 | Published: N/A

MEDIUM SEVERITY

Trustix installs the httpsd program for Apache-SSL with world-writeable permissions, which allows local users to replace it with a Trojan horse.

4. MITRE ATT&CK; Mappings

Port	Technique ID	Technique Name	Tactic
53	T1046	Network Service Discovery	Discovery
443	T1190	Exploit Public-Facing Application	Initial Access

5. Immediate Remediation & Hardening

- **Patch & Update Software:** Immediately apply vendor security updates for all identified outdated services and libraries.
- **Enforce Strict Firewall Policies:** Restrict inbound network access to essential ports only; block unused open ports.
- **Implement Strong Authentication:** Enforce multi-factor authentication (MFA) and disable password-based SSH authentication in favor of key pairs.
- **Continuous Monitoring & Auditing:** Enable continuous log monitoring, intrusion detection systems (IDS), and regular automated vulnerability assessment.
